

DATA SERIES

Safety performance indicators – Fatality and permanent impairment injuries – 2024 data

EXECUTIVE SUMMARY

About IOGP fatality and permanent impairment injury data

IOGP has set a course for our industry to focus on preventing life-changing injuries and fatalities. In 2022, an Expert Group was set up to agree a common industry definition for actual, potential and near miss fatality and permanent impairment (FPI) injuries.

Although significant progress has been made by IOGP Member Companies in reducing lost time injury rate (LTIR) and total recordable injury rate (TRIR), we have reached a plateau, as shown in Figure 1.

While a reduction in overall injury rates is positive, not all recordable or even lost time injuries are equivalent. For the purposes of TRIR, an injury that results in a single stitch to a finger has the same statistical weighting in the rate calculation as a fatality. A rate with such a broad scope of injury classification does not give any indication of the severity of the injuries. Addressing the most severe injuries, those which change people's lives needed to be prioritized, i.e. focus on what matters most.

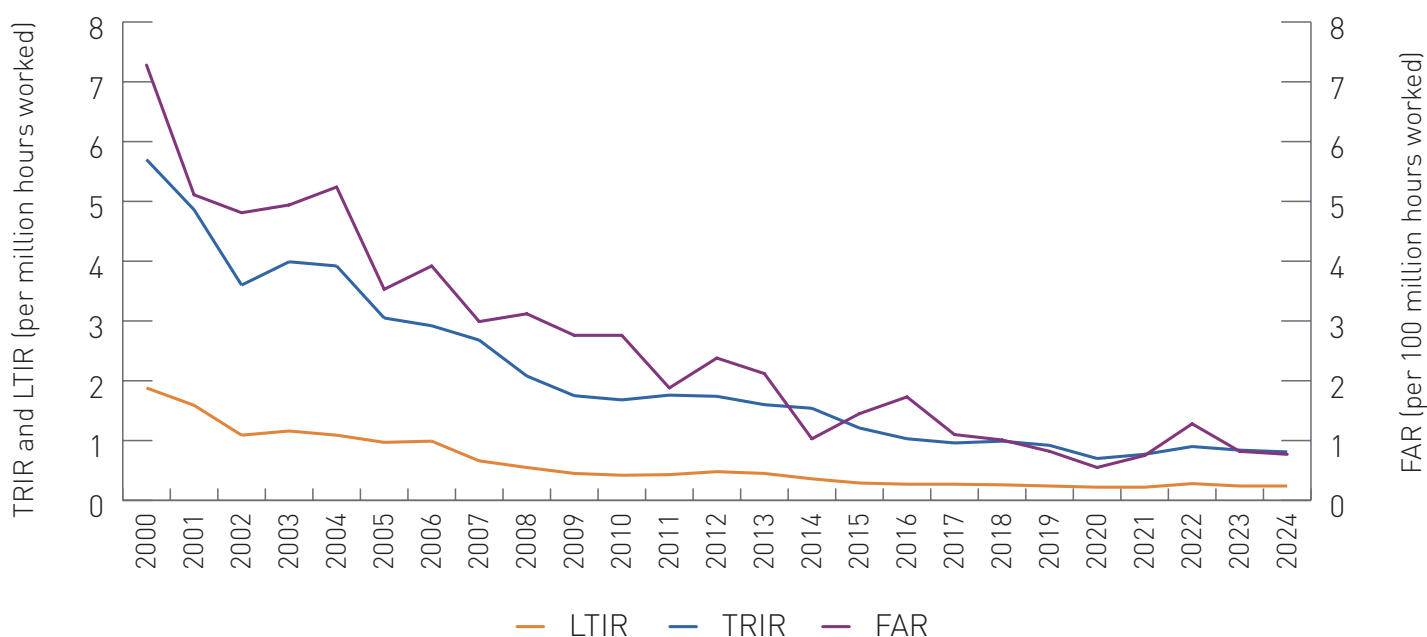

Figure 1: FAR, TRIR, and LTIR, 2000-2024

Focusing on controls and safeguards to primarily prevent fatalities has been shown to have reduced the number of recordable injuries,¹ but many organizations commit much of their Health, Safety, and Environment (HSE) resources trying to reduce the number of recordable injuries. This focus on reducing high-volume, lower severity injuries (as shown on the right-hand side of Figure 2), such as slips and trips (at the same height), cuts, punctures and scrapes, overexertion, strain, etc.) may have the desired effect on reducing TRIR, but it is highly unlikely to reduce the number of life-changing injuries and fatalities.

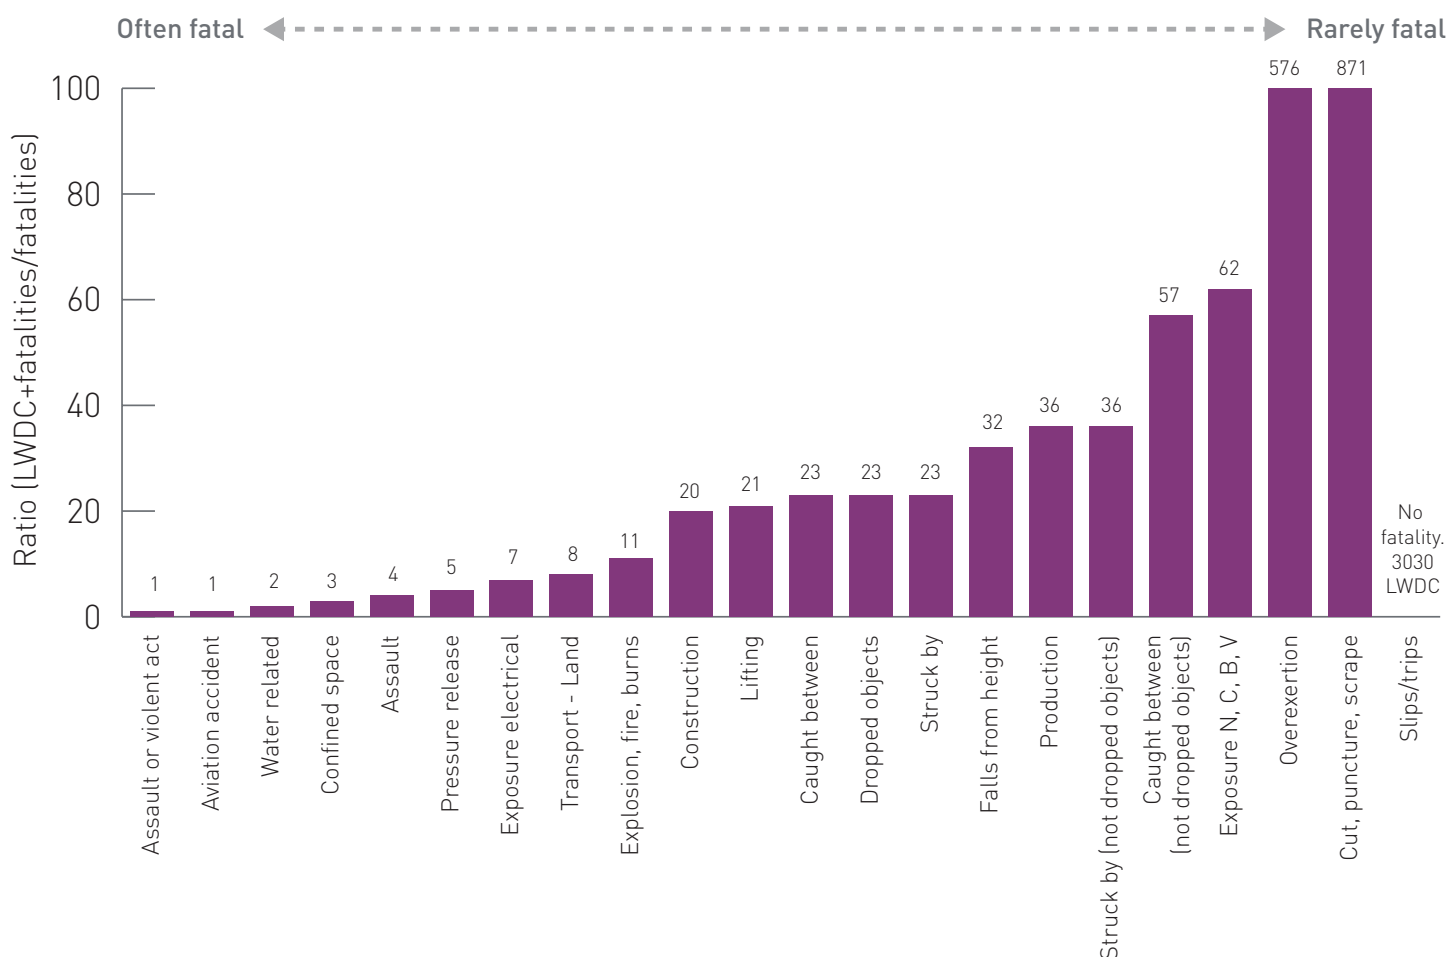

Figure 2: Fatality to LTI (fatality + LWDC) ratio by cause or activity, 2009 – 2024

The IOGP FPI definitions are designed for use in energy industry reporting. They are deliberately concise and concept based. The concepts are provided in plain language to facilitate reliable interpretation and application across a wide range of potential scenarios by industry personnel without health qualifications. The classification of a permanent impairment injury as per the definition should be determinable from a basic assessment of known injuries assisted by injury reports, medical certificates, and/or worker self-reports of current status.

These definitions are aligned to recognized international systems of classification including:

- American Medical Association (AMA) Guides to the Evaluation of Permanent Impairment²
- World Health Organization (WHO) International Classification of Functioning, Disability and Health (ICF)

For additional background on the development of the FPI definition and data collection, see SPE-220314-MS, Focusing Industry Learning on Prevention of Fatalities and Life-changing Injuries, Walker et al.

The full definition, including examples and an associated Frequently Asked Questions are available at <https://iogp.org/fpi>.

¹ Peuscher, W., Groeneweg, J., 2012

² AMA, 6th Edition.

The data in Report 2024fpi were collected from IOGP Member Companies on a voluntary basis. Information presented includes:

- Number of fatalities and PI injuries
- Fatal accident rate (FAR)
- PI rate (PIR)
- Fatality and PI rate (FPIR)
- Fatalities and PI injuries by:
 - cause and activity
 - Life-Saving Rule
 - body part injured
 - nature of injury
 - PI category and subcategory
- Results by region
- Results by function
- Results by company

A summary of the 2022 - 2024 data submission is shown in Table 1.

Table 1: Summary of results

Scope of FPI data used in this report (excludes companies not reporting permanent impairment data)	2022	2023	2024
Number of Member Companies reporting	37	57	51
Work hours (millions)	2,331	3,254	3,417
Percentage of total hours in the safety performance indicator database*	90%	99%	82%
Countries	90	90	84
Fatalities	29	27	27
PI injuries reported	16	31	35
PIR - PI injuries per 100 million hours	0.69	0.95	1.02
FPIR - FPI per 100 million hours	1.93	1.78	1.81
FAR - fatalities per 100 million hours	1.24	0.83	0.79

* The information shown in this Report is a subset of the data in Report 2024s - *Safety Performance Indicators 2024 data* because not every company that reported fatalities reported permanent impairment data. Therefore the two data sets should not be compared.

Permanent impairment injuries

In 2024, 68% were categorized as 'permanent loss of body parts' (36% in 2023, 37% in 2022), and 20% of reported PI were categorized as 'permanent reduction in skin and/or musculoskeletal function' (42% in 2023, 50% in 2022).

In 2024, 57% of reported PI were amputations with loss of bone inclusive of one or more joints (not able to be reattached) (36% in 2023, 31% in 2022), and 8% were deep burns with scarring or skin grafts that impair body movement or other function (none in 2023, 6% in 2022).

Permanent reduction in psychological, social or cognitive function: **6%**

Permanent reduction of organ function: **6%**

Permanent reduction in skin and/or musculoskeletal function: **20%**

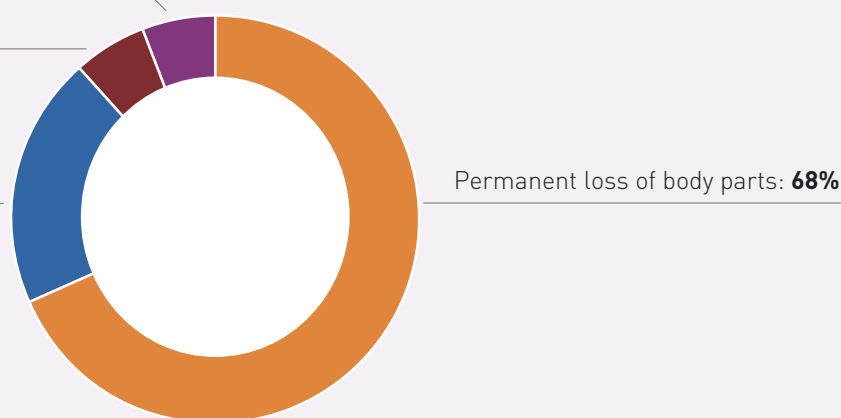

Figure 3: PI injuries by PI category 2024

Brain injury with ongoing impact to emotional regulation, speech, memory, or other cognitive dysfunction: **3%**

Fracture with ongoing impairment to mobility: **3%**

Traumatic soft tissue injury to shoulder/knee/elbow with ongoing pain and/or inadequate joint range of movement: **3%**

Eye injury with loss of vision: **3%**

Loss of eye(s): **3%**

Loss of facial structures, example: nose, ears, leading to disfigurement: **3%**

Other: **6%**

Loss of internal organs e.g. kidney, spleen (may also meet criteria 3.4.2): **5%**

Burns: deep burns with scarring or skin grafts that impair body movement or other function: **8%**

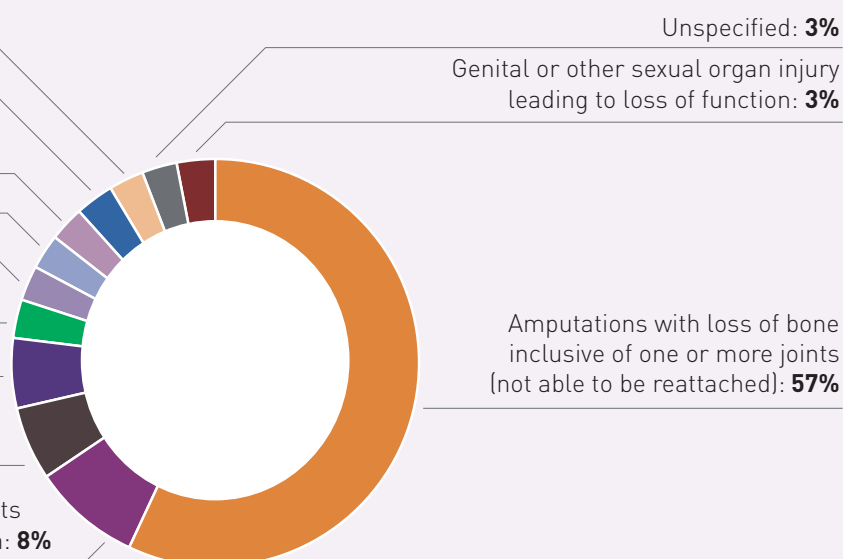

Figure 4: PI injuries by PI subcategory 2024

Assessment of the applicability of the IOGP Life-Saving Rules to fatal and PI incident descriptions for 2022-2024 data has shown that at least 83% of the reported fatal incidents and 89% of the reported PI injuries are covered by the IOGP Life-Saving Rules and may have been prevented by the adoption of this system.

Analysis of fatality and PI data (2022-2024) reported to IOGP highlights that 19% of fatalities and 61% of PI injuries were assigned a primary Life-Saving Rule of line of fire, as shown in Figure 5.

Further analysis of fatality and PI data related to line of fire has been used to develop 10 main line of fire hazard categories and a package of resource materials focused on preventing line of fire-related fatalities and PI injuries. These are available at <https://www.iogp.org/life-savingrules/>.

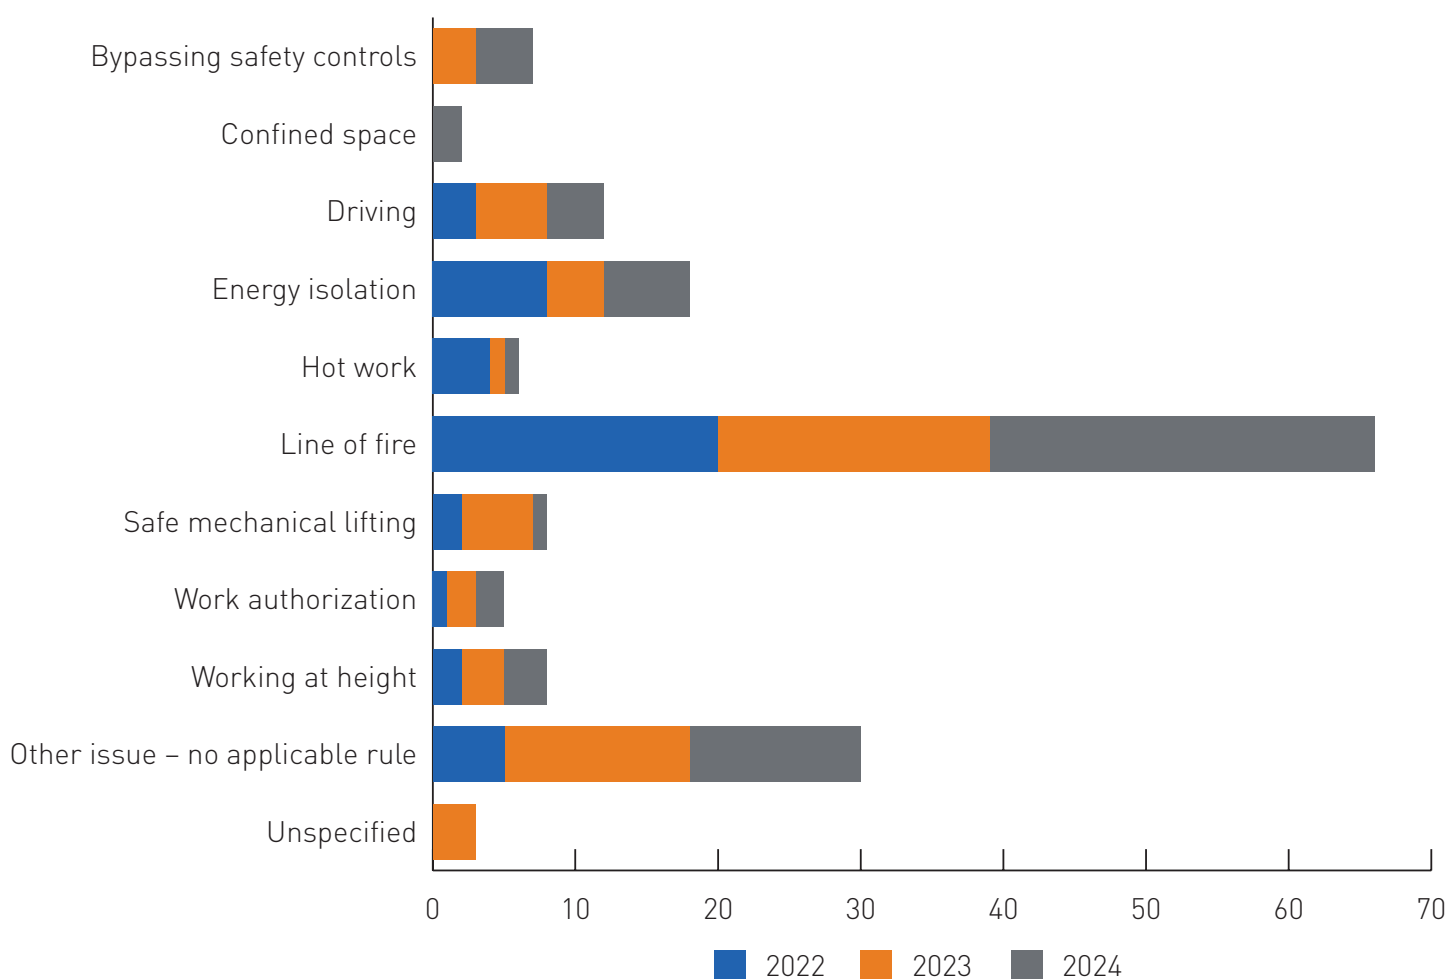

Figure 5: Fatalities and PI injuries by primary Life-Saving Rule 2022-2024
